

# SalesMate AI — Build Guide

Generative and Agentic AI for Business Applications | Chandigarh University

## Project Overview

SalesMate AI is an AI-powered lead qualification and sales automation project. The system collects customer information through Typebot, processes the information using AI, assigns a lead score and category, recommends a suitable service, and supports sales automation. The project uses fictional sample data for demonstration and testing.

| Item           | Detail                                           |
|----------------|--------------------------------------------------|
| Project        | SalesMate AI                                     |
| Main purpose   | AI-based lead qualification and sales automation |
| Customer input | Business and requirement information             |
| AI processing  | Intent, lead score, category and recommendation  |
| Analytics      | Google Colab, Python, Pandas and Matplotlib      |
| Documentation  | GitHub                                           |
| Dataset        | 30 fictional demo leads                          |

## 1. The Big Picture

### The Flow

```
graph TD
    Customer --> Typebot
    Typebot --> n8n
    n8n --> Gemini[Google Gemini AI]
    Gemini --> Intent[Intent Classification]
    Intent --> Scoring[Lead Scoring]
    Scoring --> Category[Lead Category]
    Category --> Service[Service Recommendation]
    Service --> Sales[Sales Team / Storage]
    Sales --> Analytics[Google Colab Analytics]
    Analytics --> Docs[GitHub Documentation]
```

| Part           | Role                                   |
|----------------|----------------------------------------|
| Typebot        | Collects customer information          |
| n8n            | Connects and automates the workflow    |
| Google Gemini  | Performs AI analysis                   |
| Lead Scoring   | Determines lead score                  |
| Recommendation | Suggests a suitable service            |
| Power Automate | Supports sales automation              |
| Google Colab   | Performs analytics and visualization   |
| GitHub         | Stores project files and documentation |

## 2. Concepts in Simple Words

### What is Typebot?

Typebot is used to create the customer-facing form/conversation. The SalesMate AI Typebot collects customer name, business name, business type, employee count, requirement, approximate budget, implementation timeline, email and mobile number.

### What is n8n?

n8n is used as the automation layer. It connects the customer input with the AI processing and other parts of the workflow. The team is using an n8n webhook to receive the Typebot submission.

### What is Google Gemini?

Google Gemini is used to analyze customer information. The prepared AI prompts cover Intent Classification, Lead Scoring, Product Recommendation and the main SalesMate AI analysis.

### What is Lead Scoring?

Lead scoring gives a potential customer a score from 0 to 100.

|                     |     |
|---------------------|-----|
| Clear requirement   | +20 |
| Budget provided     | +15 |
| Urgent requirement  | +20 |
| Requested quotation | +20 |
| Business details    | +10 |
| Purchase timeline   | +15 |

80-100 → HOT  
50-79 → WARM  
0-49 → COLD

## 3. Build It Step by Step

### Step 1: Create the Typebot

A Typebot was created to collect customer information. The questions collect customer name, business name, business type, employee count, requirement, approximate budget, implementation timeline, email and mobile number.

### Step 2: Connect Typebot to n8n

The Typebot data is intended to be sent to n8n through a webhook. The n8n test webhook provided by the team is:

<https://sukanya23.app.n8n.cloud/webhook-test/salesmate-lead>

The connection uses a POST request. The final Typebot-to-n8n connection and final n8n workflow are being completed by the team.

### Step 3: AI Intent Classification

The Intent Classification module analyzes the customer's message. Possible intents are Product Enquiry, Pricing, Recommendation, Sales, Support and Other. The module returns Intent, Confidence and Reason.

### Step 4: AI Lead Scoring

The Lead Scoring module analyzes customer information and calculates a score out of 100 using the defined scoring factors. The final score determines whether the lead is HOT, WARM or COLD.

### Step 5: AI Service Recommendation

The Product Recommendation module analyzes the customer's requirement and recommends a suitable service based only on the information provided. The recommendation also includes a short reason.

### Step 6: Main SalesMate AI Analysis

The main AI module is designed to identify Intent, Customer industry, Requirement, Budget, Timeline, Lead score, Lead category and Recommended service. The output is designed as JSON so that it can be processed easily by the automation workflow.

## 4. Dataset and Analytics

A fictional dataset containing **30 sample leads** was created for testing and analytics.

Lead ID  
Customer Name  
Business Name  
Industry  
Employee Count  
Requirement  
Budget  
Timeline  
Lead Score  
Lead Category  
Recommended Service  
Conversion Status

## Google Colab

Google Colab was used to analyze the dataset. Python, Pandas and Matplotlib were used. The analysis calculates total number of leads, HOT/WARM/COLD distribution, most requested services, average lead score, conversion rate and industry-wise enquiries. Four visualizations cover Lead Category Distribution, Most Requested Services, Industry-wise Enquiries and Conversion Status.

## 5. GitHub Repository

A GitHub repository named **SalesMate-AI** was created to organize the project.

```
SalesMate-AI/  
■■■ README.md  
■■■ project-documentation.md  
■■■ build-guide.md  
■■■ workflows.md  
■■■ Build prompts.docx  
■■■ workflows/  
■■■ colab/  
■■■ data/  
■■■ screenshots/
```

The repository stores project documentation, the dataset, Colab notebook, workflow files, screenshots and AI prompts.

## 6. Testing

Fictional sample leads are used for testing. The dataset contains different industries, requirements, budgets, timelines, lead scores, lead categories and conversion statuses. Testing also includes Google Colab analytics and visualizations. Screenshots from different parts of the project are stored in the GitHub screenshots folder.

## 7. Troubleshooting

| Problem                      | Possible cause               | Action                                |
|------------------------------|------------------------------|---------------------------------------|
| Typebot data is not received | n8n connection is incomplete | Check the webhook and POST connection |
| AI result is incorrect       | Input or prompt issue        | Check customer input and AI prompt    |
| Lead category is incorrect   | Score calculation issue      | Check scoring factors                 |
| Colab cannot read dataset    | File name/path issue         | Check uploaded CSV filename           |
| Chart is not displayed       | Code/data issue              | Run analytics cells again             |
| GitHub file is missing       | File was not committed       | Check repository and commit history   |

## 8. Responsible Use

- Use fictional data for demonstrations and testing.
- Do not upload real customer personal information to the public repository.
- Do not publish private API keys, tokens or credentials.
- AI results should be reviewed before being used for real business decisions.
- The project is an academic demonstration of AI-based sales automation.

## 9. Project Files

| File                     | Purpose                          |
|--------------------------|----------------------------------|
| README.md                | Project overview                 |
| project-documentation.md | Detailed project documentation   |
| build-guide.md           | Step-by-step project build guide |
| workflows.md             | Workflow information             |
| Build prompts.docx       | AI prompts                       |
| colab/                   | Google Colab notebook            |
| data/                    | Demo dataset                     |
| workflows/               | Automation workflow files        |
| screenshots/             | Project screenshots              |

## 10. Current Project Status

### Completed

- Typebot customer information collection
- AI prompts
- 30-lead fictional dataset
- Google Colab analytics
- Data visualizations
- GitHub repository
- Project documentation
- Build Guide
- Screenshots

### In Progress

- Final Typebot → n8n connection
- Final n8n workflow export

## 11. Final Workflow

## 12. Conclusion

SalesMate AI demonstrates how AI can be used to collect customer requirements, analyze potential leads, calculate lead scores, classify leads, recommend services and support sales automation. The project combines Typebot, n8n, Google Gemini, Google Colab, Python, Pandas, Matplotlib, Power Automate and GitHub into a single academic

demonstration.
